# A survey of the Amerioppia species (Acari, Oribatei)

By P. Balogh\*

Abstract. A short diagnosis of the genus Amerioppia Hammer, 1961 is given. Identification keys to eight artificial species groups and 41 known species are added.

The genus Amerioppia was established by Hammer (1961). Generic diagnosis:

Five pairs of genital setae. Nine or ten pairs of notogastral setae: setae  $c_2$  (= ta) present or absent. Prodorsum without costula. Notogaster without crista. Sensillus fusiform or lanceolate. Interlamellar setae absent. Exostigmatal setae strong, ciliate. Rostral setae originating on the upper side of the rostrum. Three (or two) pairs of interbothridial sigilla present. Lyrifissurae iad in adanal position: near to anal plates. Genital plates smaller than anal plates, slightly narrowing forwards.

Type-species: Amerioppia rudentigera HAMMER, 1961.

I have found 41 species in the literature that may be placed in the genus Amerioppia. The great majority of the species seems to be well established, still at places the differences are hard to describe and merely quantitative. My opinion is that in the descriptions and drawings of the Oribatida species published in the last 30 years a huge mass of information is hidden that should be brought to light. In case a drawing is made by the help of the Abbé apparatus and good care was taken in tracing, the author fixes such information that will only be used in the future when separating the species. The description in oribatidology is far more important than in any other group of animals. The types, especially those of old authors, have been preserved on permanent slides. With the passing time some are squashed and only fragments are recognizable. In such cases that original description harbours a great deal of information more than the squashed specimen. One of the aims of my contribution is to present an identification key which was constructed on these bases. Although some of the data (e.g. the length of setae, the distance of insertion points) might seem to be uncertain, practice shows that this kind of a key much facilitates identification.

<sup>\* 1)</sup>r. Péter Balogh, ELTE Állatrendszertani és Ökológiai Tanszék, (Department of Systematie Zoology and Ecology of the Eötvös Loránd University), 1088 Budapest, Puskin u. 3.

My other aim is to throw light on some interesting trends of distribution of the Amerioppia species. Although the continents are not equally explored from the point of view of oribatid mites, we have such a quantity of information that allows to ascertain, at least, the principal trends of distribution. The picture concerning the 41 Americannia species is quite surprising. The majority of the species lives in the higher altitudes of the Neotropical and the Ethiopian Regions, as well as in the southernmost parts of the southern continents. There are 31 such species, a total of 75%. The remaining 10 species (25%) are found in the Holarctic and the Oriental Regions, 2 and 5 species, respectively, and in the Pacific region, where 3 species are found. The former 31 species live on the parts of Gondwana while the rest in Laurasia. Out of the 10 species, five live, as do the 31 species, in the Southern Hemisphere. Consequently, we may establish on the basis of the 41 known Amerioppia species, that the majority lives in the higher mountains of the Southern Hemisphere; especially in the tropical moss forests and montane forests, where the diversity of the species is the highest. It is quite likely that these were the places where speciation took place at the highest rate in the historical geological epochs.

#### Identification keys to the species groups

## 1. barrancensis group

1 (2) Rostral setae originating far from each other, almost parallel. Interpretable lamellar region punctulate. Sensillus setiform, with very slightly dilated distal half. L: 293 μm; W: 153 μm. – USA
minuta (Ewing, 191
2 (1) Rostral setae originating near each other, geniculate. 3 (4) Lamellar lines slightly converging. Apical half of sensillus well dilated.
L: 300 $\mu$ m; W: 172 $\mu$ m – Peru, Mexico
4 (3) Lamellar lines parallel. Distal half of sensillus very slightly dilate 5 (6) Short median line between the light spots in the interlamellar ar present. Setae $p_1$ only a little shorter than $r_1$ . L: 260 $\mu$ m; W: 184 $\mu$ m. — Java
javensis Hammer, 19
6 (5) Median line between the light spots in the interlamellar area abserbetae $p_1$ more than twice shorter than $r_1$ . L: 256 – 279 $\mu$ m; W: 145 – 1
μm. – Paraguay paraguayensis (Balogh & Mahunka, 198
2. longicoma group
1 (2) Lamellar setae long: as long as the distance of $le$ - $ro$ . Setae $c_2$ abservate lp twice longer than $r_1$ . Larger species, L: 520 $\mu$ m; W: 280 $\mu$ m.
— Bolivia, 4900—5400 m longicoma Наммен, 19
2 (1) Lamellar setae short: distance of $le\text{-}ro$ more than twice longer the lamellar setae. Setae $c_2$ present. Setae $lp$ as long as or only a little long than $r_1$ . Smaller species, L: 291-307 $\mu\text{m}$ ; W: 160-168 $\mu\text{m}$ . — Ta
zania extrusa Mahunka, 19
3. decemsetosa group
1 (4) Setae $h_2$ thrice or more longer than $h_1$ . 2 (3) Setae $p_1-p_3$ short, not longer than $h_1$ . The five long notogastral set ( $la$ , $lm$ , $lp$ , $h_2$ and $h_3$ ) rigid. L:246 $\mu$ m; W:139 $\mu$ m. — Columbia
2700 m sturmi P. Balogh, 196
3 ( 2) Setae $p_1-p_3$ longer than $h_1$ . The five long notogastral setae with flagella end. L: 291 – 295 $\mu$ m; W: 162 – 170 $\mu$ m. — Fiji Islands aelleni Mahunka, 198
4 (1) Setae $h_2$ either as long as or, at most, twice longer than $h_1$ . 5 (6) Setae $h_1$ as long as $h_2$ . Lamellar line present. L: 281-310 $\mu$ m; W 150-160 $\mu$ m Ethiopia
150-160 μm Ethiopia polygonata Mahunka, 198

			Setae $h_1$ shorter than $h_2$ . Lamellar line absent. Setae $c_2$ absent. Alveoli of rostral setae almost touching. The light spots in the interlamellar area of different sizes: the first and second pairs smaller, the third ones larger. Only the distal third of sensillus slightly
			dilated. L : 265 $\mu$ m. — Sahara
8	(	7)	Setae $c_2$ present. Alveoli of rostral setae well separated. The light spots in the interlameller area almost of the same size. The distal half of sensillus very slightly dilated. L:370 $\mu$ m; W:199 $\mu$ m. — Samoa decemsetosa Hammer, 1973
			$4.\ longiclava\ group$
			Setae $c_2$ absent. Setae $p_1$ longer than $p_2$ and $p_3$ . Two very similar species. The end of sensillus with a long and gradually attenuated tip. Vertical separating lines between the light spots of interlamellar area absent. L: $300-320~\mu\mathrm{m}$ ; W: $180~\mu\mathrm{m}$ . — Patagonia, New Zealand longiclava Hammer, 1962
3	(	2)	The end of sensillus with short, abruptly attenuated tip. Two vertical separating lines between the light spots of interlamellar area present. L: 245 $\mu$ m; W: 149 $\mu$ m Fiji
			$12:245~\mu \text{m}$ , W: 149 $\mu \text{m}$ . — Fiji
4	(	1)	Setae $c_2$ very short but present. Setae $p_1$ to $p_3$ of the same length. Two very similar species.
5	(	6)	Rostral setae geniculate. L: 250 $\mu$ m; W: 139 $\mu$ m. — Java ventrosquamosa Hammer, 1980
6	(	5)	Rostral setae only slightly curved. L: 320 – 360 $\mu$ m; W: 180 – 208 $\mu$ m.
			- Peru chavinensis Hammer, 1961
			5. espeletiarum group
1	(	2)	Notogaster outside of setae $c_2$ each with an oblique longitudinal line, resembling a crista. L: 360 $\mu$ m. — El Salvador salvadorensis (WoAs, 1986)
2	(	1)	Notogaster outside of setae $c_2$ without an oblique longitudinal line.
3	(	4)	Two extremely similar species. Prodorsal and notogastral setae smooth. L: $328-414~\mu m$ ; W: $189-230~\mu m$ . — Columbia, 3700 m, Espeletia
4	(	3)	Prodorsal and notogastral setae finely ciliate. L: 340 $\mu$ m; W: 180 $\mu$ m
			- Germany (Schwarzwald) badensis (Woas, 1986)

#### 6. chilensis group

- 1 (4) Setae  $h_2$  relatively near to each other: distance of  $h_2-h_2$  less than twice longer than distance of  $h_1-h_1$  and always much shorter than that of lm-lm.
- 2 (3) Setae  $c_2$  present. Alveoli of rostral setae almost touching. Lamellar line present. L: 285 299  $\mu$ m; W: 152 166  $\mu$ m. Columbia, 4000 m . . . . cocuyana P. Balogh, 1984
- 4 (1) Setae  $h_2$  far from each other: distance of  $h_2 h_2$  at least thrice longer as distance of  $h_1 h_1$  and always longer than that of lm lm.
- 5 ( 6) Sensillus lanceolate: the lanceolated distal part as long as the stalk. L:300  $\mu$ m; W:150  $\mu$ m. Peru, 3750 m . . . . . . . . . . . paripilis Hammer, 1961
- 6 (5) Sensillus with a fusiform head: the dilated distal part shorter than the stalk.
- 7 (8) Sensillus finely granulate. The three pairs of light spots in the interlamellar area connected with united circular field. Setae  $p_1$  to  $p_3$  medium long, curved ventrally. L: 292-310  $\mu$ m; W: 158-176  $\mu$ m. Tanzania foveolata Mahunka, 1984

### 7. lanceolata group

- 1 (4) Setae  $c_2$  absent.

- 4 (1) Setae  $c_2$  present.
- 5 (6) Sensillus much longer than the distance of bothridia, with a pointed, long tip and with very short, scattered cilia. Setae  $h_2$  twice longer than  $h_1$  and as long as  $p_1$ . L: 366-405  $\mu$ m; W: 230-247  $\mu$ m. Rhodesia ankae Mahunka, 1974

7 Opuscula Zoologica 97

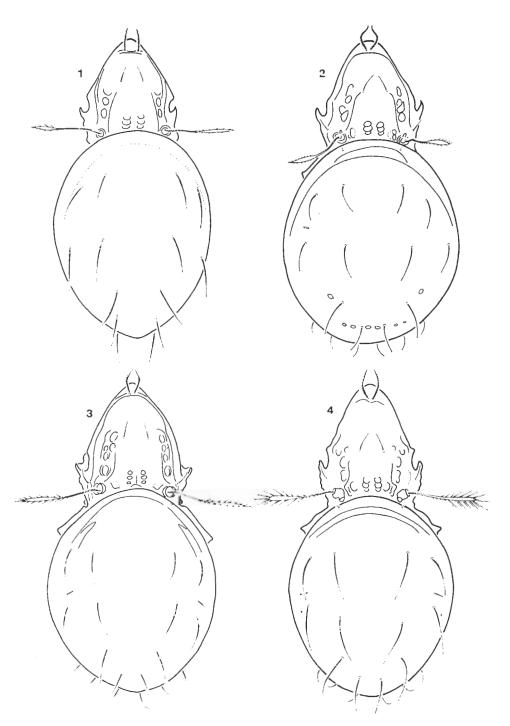

6	(	5)	Sensillus only a little longer than the distance of bothridia, without long and pointed tip. Setae $h_2$ as long as $h_1$ and much longer than $p_1$ .
7	(	3)	Setae $p_1$ to $p_3$ extremely short, hardly visible. Sensillus with gradually dilated and apically rounded tip. L: 287-353 $\mu$ m; W: 172-197 $\mu$ m.
			— West Africa deficiens (Валодн, 1959)
8	(	7)	Setae $p_1$ to $p_3$ not very short. Sensillus only slightly lanceolate.
9	(	<b>1</b> 0)	Surface of prodorsum finely punctate; the anterior part finely striped. The whole surface is finely punctate. along the borders finely striped. L:360 $\mu$ m; W:296 $\mu$ m Peru, 3000 m
			pectigera Hammer, 1961
10	(	9)	Surface of prodorsum and notogaster smooth. L: $366-379~\mu m$ ; W: 223 $\mu m$ . — East Africa
			µm. — East Africa meruensis Валодн, 1961
			8. rudentigera group
1	(	2)	Seven pairs of notogastral setae (la, lm, lp, $h_1$ , $h_2$ , $h_3$ and $p_1$ ) long, with a dilated and fusiform tip. Setae $c_2$ present, small, $p_2$ and $p_3$ a little longer. Sensillus short, with a dilated head. L: $410-424~\mu m$ ; W: $236-250~\mu m$ . — Antilles: St. Lucia
			extrema Mahunka, 1984
2	(	1)	Notogastral setae setiform, normal, without dilated tip.
3	(	8)	Setae $c_2$ absent.
4	(	5)	Setae $h_1$ shorter than $h_2$ . L:340 $\mu$ m; W:196 $\mu$ m. – New Zealand, Fiji
			woolleyi Hammer, 1968
5	(	4)	Setae $h_1$ as long as $h_2$ .
6	(	7)	Prodorsum smooth. Smaller species. L: 450 $\mu$ m; W: 220 $\mu$ m. — Bolivia, Peru, 4600 m.
			trichosa (HAMMER, 1958)
7	(	6)	Prodorsum distinctly punctate. Larger species. L: $560-570~\mu m$ ; W: $340-350~\mu m$ . — Peru
			trichosoides Hammer, 1961
8	(	3)	Setae $c_2$ present.
9	(	10)	Rostral setae geniculate. There is an auriculate outgrowth on the medial side of bothridia. Sensillus very finely ciliate. L: $26P-285~\mu m$ ; W: $150-170~\mu m$ . — Hong-Kong
			interrogata Mahunka, 1976
10	(	9)	Rostral setae not geniculate. Bothridia without auriculate outgrowth.

		260 $\mu$ m; W: 150 $\mu$ m. — Peru
12	(11)	Larger species, $320-770~\mu\mathrm{m}$ long. Set ae $p_1$ to $p_2$ of the same length.
13	(14)	Giant, chestnut brown species, 770 $\mu$ m. Notogastral setae rough and equally thick throughout. Prodorsum punctate. L: 770 $\mu$ m; W: 477 $\mu$ m. Peru, 3550 m.
		rudentigera Hammer, 1961
14	(13)	Smaller and lighter species: $320-520 \mu m$ .

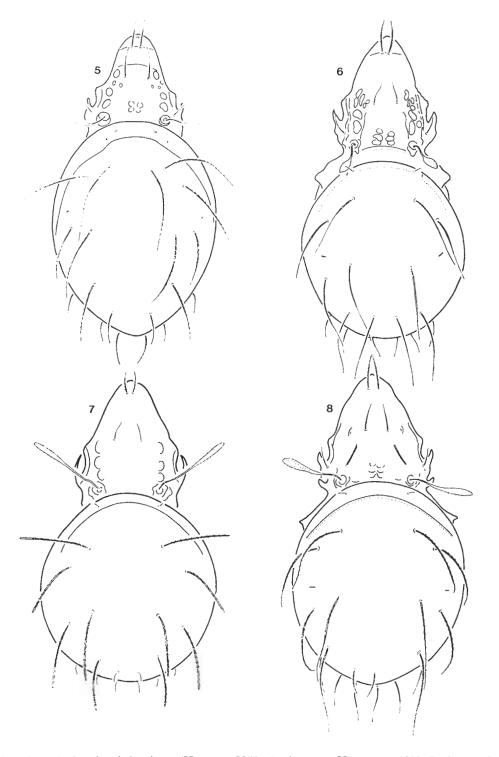

11 (12) Minute species, 260  $\mu$ m long. Setae  $p_1$  about twice longer than  $p_2$ . L:

- 15 (16) Three pairs of notogastral setae: la, lm and lp longer than setae h. L: 450  $\mu$ m; W: 248  $\mu$ m. - Peru, 3300 m. hexapilis Hammer, 1961
- 16 (15) Five or six pairs of the notogastral setae of the same length.
- 17 (18) Setae  $h_1$  shorter than  $h_2$ , thus only five pairs of notogastral setae of the same length. L: 420  $\mu$ m; W: 226  $\mu$ m. – Pakistan, 3000 m. . . . . . . . . . . asiatica Hammer, 1977
- 18 (17) Setae  $h_1$  as long as setae  $h_2$ , thus six pairs of notogastral setae of the same length.
- 19 (20) Sensillus short, with short stalk and a broad, fusiform pointed head. senecionis P. Balogh, 1984
- 20 (19) Sensillus longer, with a medium long stalk and gradually dilated fusiform head.
- 21 (22) Rostral setae near to each other: alveoli almost touching. Lamellar setae far behind: distance of le-ro much longer than lamellar setae. L:  $320-352 \mu m$ ; W:  $184-212 \mu m$ . — South Africa africana Kok, 1967
- 22 (21) Rostral setae well separated. Lamellar setae ahead: distrance of le-ro as long as lamellar setae. L: 520  $\mu$ m; W: 323  $\mu$ m. – Chile ......... similis Covarrubias, 1967
